## Abstract

This article explains how to format your contribution before submitting it to the European Journal of Mechanical and Environmental Engineering, using LaTeX. Please note that the paper can also be realized with Microsoft Word, for which a model is also available.

The models are available from the web site of the Belgian Society of Mechanical and Environmental Engineering (<http://www.bsmee.be>).

**Keywords:** Latex, Template, Mechanical Engineering

## 1 Getting started

Just start from the LaTeX model that you will find on the web site of the Belgian Society of Mechanical and Environmental Engineering ([www.bsmee.be](http://www.bsmee.be)). All instructions are specified and commented. The format is inherited from the ejmee package.

Briefly, just write your paper as usually under LaTeX. The only particularity is the construction of the head of the paper (title, authors, affiliations, abstract and keywords).

## 2 Packages

If, for some reason, a particular package had to be used, please be sure that it is included in the common LaTeX distributions.

## 3 Length of the paper

The paper should not exceed 6 pages.

## 4 Head

The head of the paper (title, authors, affiliations, abstract and keywords) is particular as it covers the entire width of the page.

It is built from the specific command `EJMEEtitle`,

which is completely explained in the sample file. Don't worry if you don't see the title when visualizing the `dvi` file. It is due to the white color. It is however perfectly visible in the postscript or pdf version.

## 5 Body of the article

### 5.1 Sectioning

The document will be sectioned with the usual `\section` and, if necessary, `\subsection` commands. The command `\subsubsection` shouldn't be necessary due to the limited length of the papers.

### 5.2 Equations and figures

Equations will be written by means of the usual `equation` or `eqnarray` environments. They will be automatically right-numbered.

$$a = b + c \quad (1)$$

Figures will be included by means of the `figure` environment and will be centered, so that they look like figure 1. Text in the figure should be approximately the same size as the one of the paper. Always specify a caption and a label so that the figure can be referred to by the `\ref` command. All

Figure 1: A circle and an ellipse in a rectangle

figures will be provided in encapsulated postscript format for the final version.

If necessary, a figure can be placed over the entire width of the page by means of the `figure*` environment.

Event	year	month
1	1964	october
2	1997	july

Table 1: Important events

Tables will be included by means of the `table` environment and will be centered, so that they look like figure 1.

## 6 Bibliography

If you use `bibtex`, select the plain bibliography style. If you use the `thebibliography` environment, follow the example below.

The references will be referred to in the text by the usual `\cite` command.
